

Amendments to the Claims:

The following listing of claims will replace all prior versions, and listings, of claims in the application:

1. (Currently Amended) A plastic lens produced by injection molding of resin material, comprising:

a lens part;

a flange part on a periphery of a lens surface, the lens part, the flange part
having a flange surface on at least one side of the flange part having a part higher than the
lens surface and a depressed part formed on at least a part thereof, of the flange surface; and

a marking integrally molded by injection molding to a marking surface of the
depressed part, the marking having a convex shape, a highest point of the marking being
lower than a highest point of the flange surface.

2. (Currently Amended) ~~A plastic~~The plastic lens according to Claim 1, wherein the flange part has a cutout portion in an outer side surface thereof.

3. (Currently Amended) ~~A plastic~~The plastic lens according to Claim 1, wherein the flange surface of the depressed part is mirror-finished at least in a vicinity of an area where the marking is formed.

4. (Currently Amended) ~~A plastic lens produced by injection molding of resin material, comprising:~~

~~—— a flange part on a periphery of a lens surface, a flange surface on at least one side of the flange part having a part higher than the lens surface; and~~

~~—— a marking integrally molded to the flange surface by injection molding.~~The plastic lens according to Claim 1, wherein the marking is for identifying a production jig used to produce the lens.

5-8. (Canceled)

9. (Original) An optical pickup device having the lens according to Claim 1.

10-21. (Canceled)

22. (New) A plastic lens produced by injection molding of resin material comprising:

a lens part having first and second convex lens surfaces, the second convex lens surface opposing the first convex lens surface; and

a flange part formed on a periphery of the lens part, the flange part comprising:

a first portion having a surface higher than the first convex lens surface;

a second portion having a surface lower than the surface of the first portion;

a marking formed on the surface of the second portion and arranged apart from the first convex lens surface, a highest point of the marking being lower than a highest point of the surface of the first portion; and

a slope inclined toward the first convex lens surface and provided between the surface of the second portion and the first convex lens surface.

23. (New) The plastic lens according to Claim 22, comprising the flange part further comprises a second marking formed on the surface of the second portion and arranged apart from the first convex lens surface, a highest point of the second marking being lower than the highest point of the surface of the first portion of the flange part.

24. (New) The plastic lens according to Claim 23, wherein the first marking has a first shape and the second marking has a second shape different from the first shape.

25. (New) The plastic lens according to Claim 22, wherein $2 < M/W < 10$ is satisfied, where M is a width of the first marking and W is a width of the surface of the second portion.

26. (New) The plastic lens according to Claim 22, the flange part further comprising a depressed part formed on a side of the second convex lens, and the slope is arranged inward of the depressed part.

27. (New) A plastic lens produced by injection molding of resin material, the plastic lens comprising:

a lens part;

a flange part formed on a periphery of the lens part and including a flange surface;

a first marking formed on the flange surface; and

a second marking formed on the flange surface, wherein a relative position of the first marking and the second marking is determined according to a type of production jig used to produce the plastic lens.

28. (New) The plastic lens according to Claim 27, wherein the first marking has a convex shape, and the second marking has a convex shape.

29. (New) The plastic lens according to Claim 28, wherein each of the first marking and the second marking is formed inside a depressed part that is formed on the flange surface.

30. (New) The plastic lens according to Claim 29, wherein a highest point of each of the first and the second markings is lower than a highest point of the flange surface.

31. (New) A plastic lens produced by injection molding of resin material comprising:

a lens part having first and second lens surface, the second lens surface opposing the first lens surface; and

a flange part formed on a periphery of the lens part, the flange part comprising:

a first portion having a surface higher than the first lens surface;

a second portion having a surface lower than the surface of the first portion;

a marking having a convex shape, the marking formed on the surface of the second portion and arranged apart from the first lens surface, a highest point of the marking being lower than a highest point of the surface of the first portion; and

a slope inclined toward the first lens surface and provided between the surface of the second portion and the first lens surface.
